

Fy1300-5.0V-1712

Imax:750mA, Vin:2.5V~20V, 1.7cm*1.2cm, Buck-Boost

➤ Description

The Fy1300-5.0V module adopts Buck-Boost DC-DC scheme, which can provide 5.0V power output under a wide voltage input of 2.5V-20V, with a maximum output current of 750mA, low static current of 150uA @ (Vin=2.5V), and a working frequency of up to 1.2MHz.

The module has a small size, high stability, high cost-effectiveness, and a sinking gold and half hole process, which is both beautiful and convenient for SMT. It can also be inserted into bread boards or hole boards, making it convenient for DIY players to use.

➤ Application Scenarios

Microcontroller power system, CNC power supply, communication equipment, toys, aircraft models, home appliances, security monitoring, field collection, street lights, DIY production, etc. Before using the module, please refer to the "Precautions" section to avoid damaging the module due to incorrect operations.

^② Using an oscilloscope for testing, use a grounding spring to measure the output terminal. During the test, turn on the 20MHz bandwidth display with a time base of 20ms or 10ms, and measure its peak to peak value.

^③ Vout(max): When fully loaded, adjust the input voltage to slowly change within the full voltage range, and record the maximum output voltage value. Similarly, Vout (min) is the minimum output voltage value recorded.

➤ Precautions

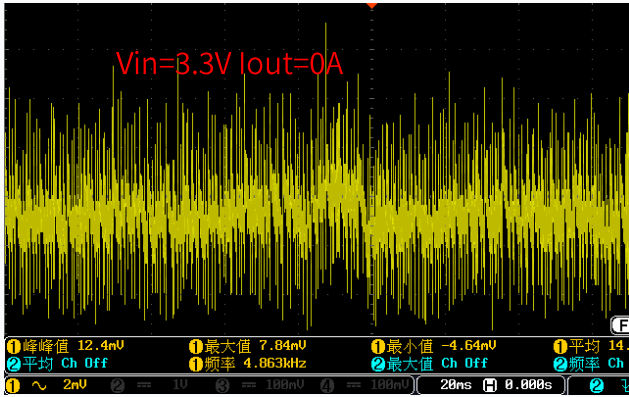

In actual use, improper power on operation may lead to module burnout. The reason for this is that the voltage at the moment of power on is too high, such as hot insertion, live contact with the access module, and switch on/off connection, which can all cause such problems. If the power quality is poor or the subsequent load is large, it can also exacerbate such situations.

To effectively avoid such problems, it is necessary to limit the voltage during power on.

- ✧ Method 1 : Parallel connection of a 47µF electrolytic capacitor at the power input terminal.
- ✧ Method 2 : Add self recovery fuses and TVS devices to the power input terminal.
